Downscaled CMIP5 (circa 2010) Climate Projections

## Region 4 (New York City) – Temperature

Baseline (1971-2000) 54.6 °F	Low Estimate (10th Percentile)	Middle Range (25th to 75th Percentile)	High Estimate (90th Percentile)
2020s	+ 1.5 °F	+ 2.0 to 2.9 °F	+ 3.2 °F
<u>2050s</u>	+ 3.1 °F	+ 4.1 to 5.7 °F	+ 6.6 °F
2080s	+ 3.8 °F	+ 5.3 to 8.8 °F	+ 10.3 °F
2100	+ 4.2 °F	+ 5.8 to 10.4 °F	+ 12.1 °F

Source: NYSERDA ClimAID, Supplement to Report 11-18

Based on assessment of downscaled projections from 35 CMIP5 climate models and 2 emission scenarios.

# Example of Day-to-Day Variability

- Use historic period from 1971 to 2000 to set variability.
- Period has representative extremes:  
e.g. in 1993, 39 days with max T > 90°F

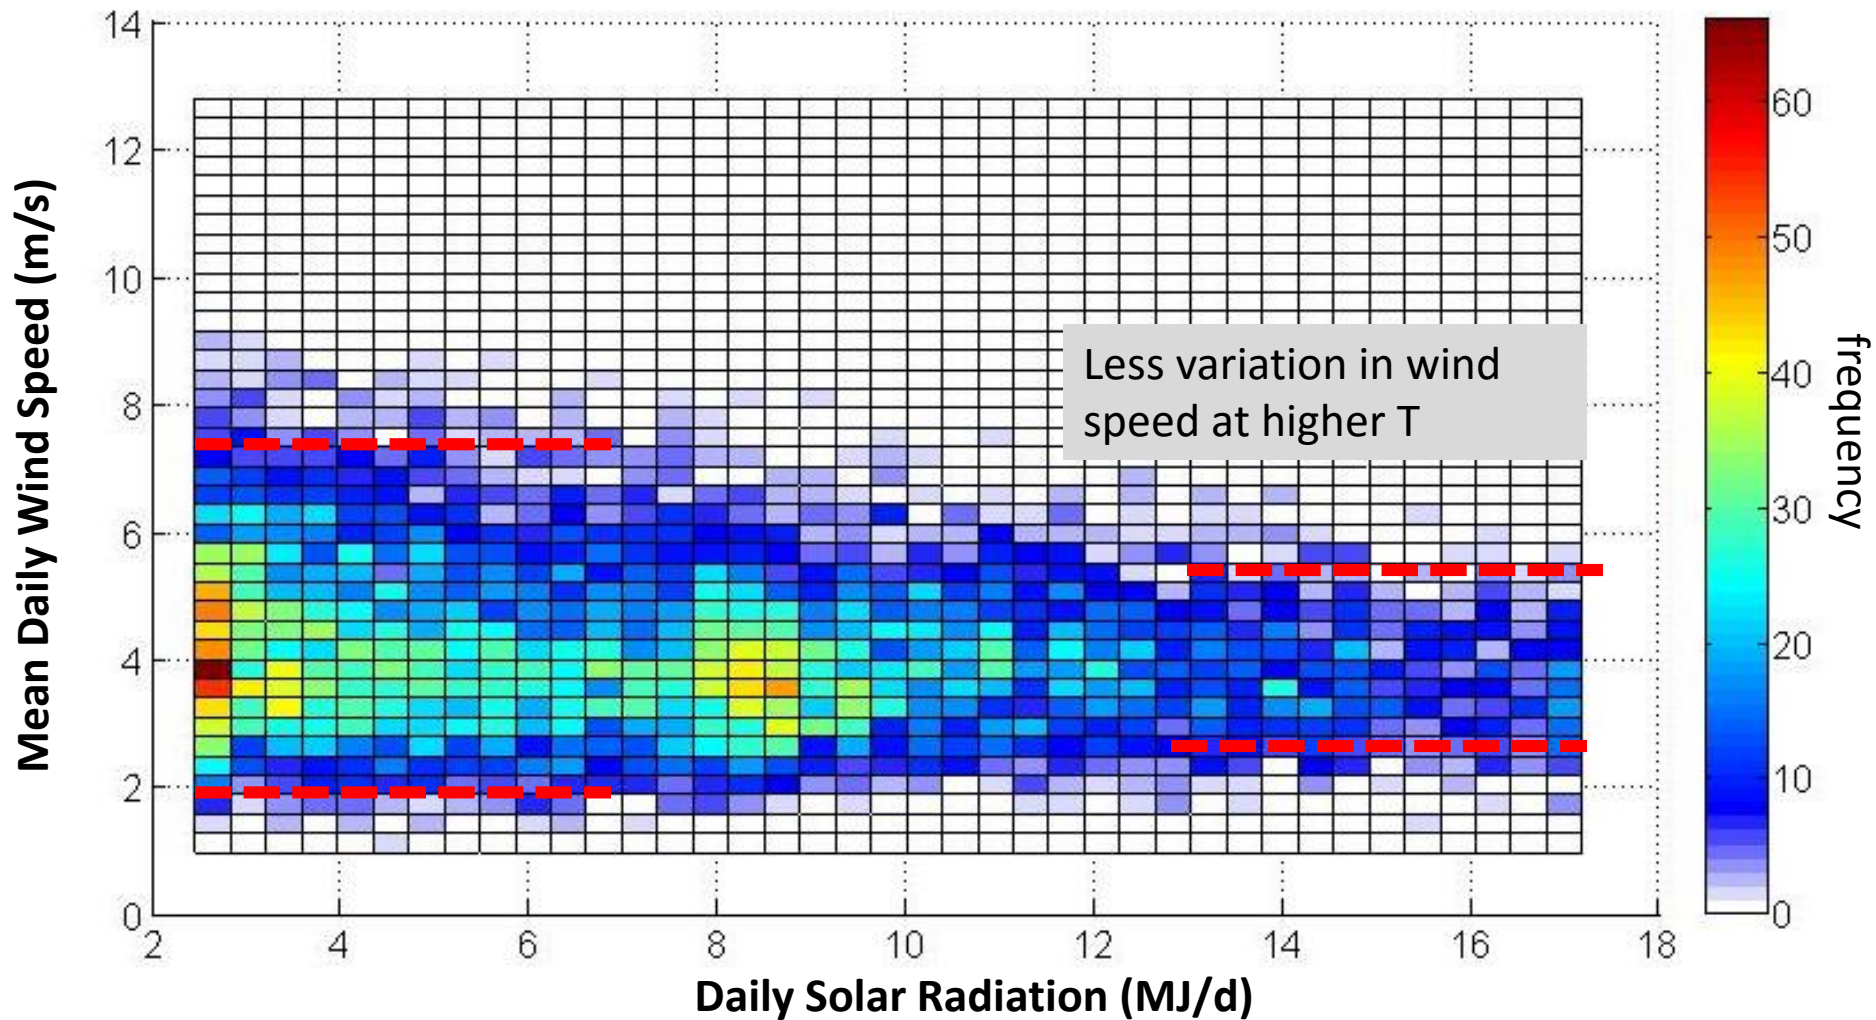

# Example of Day-to-Day Variability (Summer 1993)

In suite of GCM runs, will look at 50<sup>th</sup> and 82<sup>nd</sup> percentile increase.

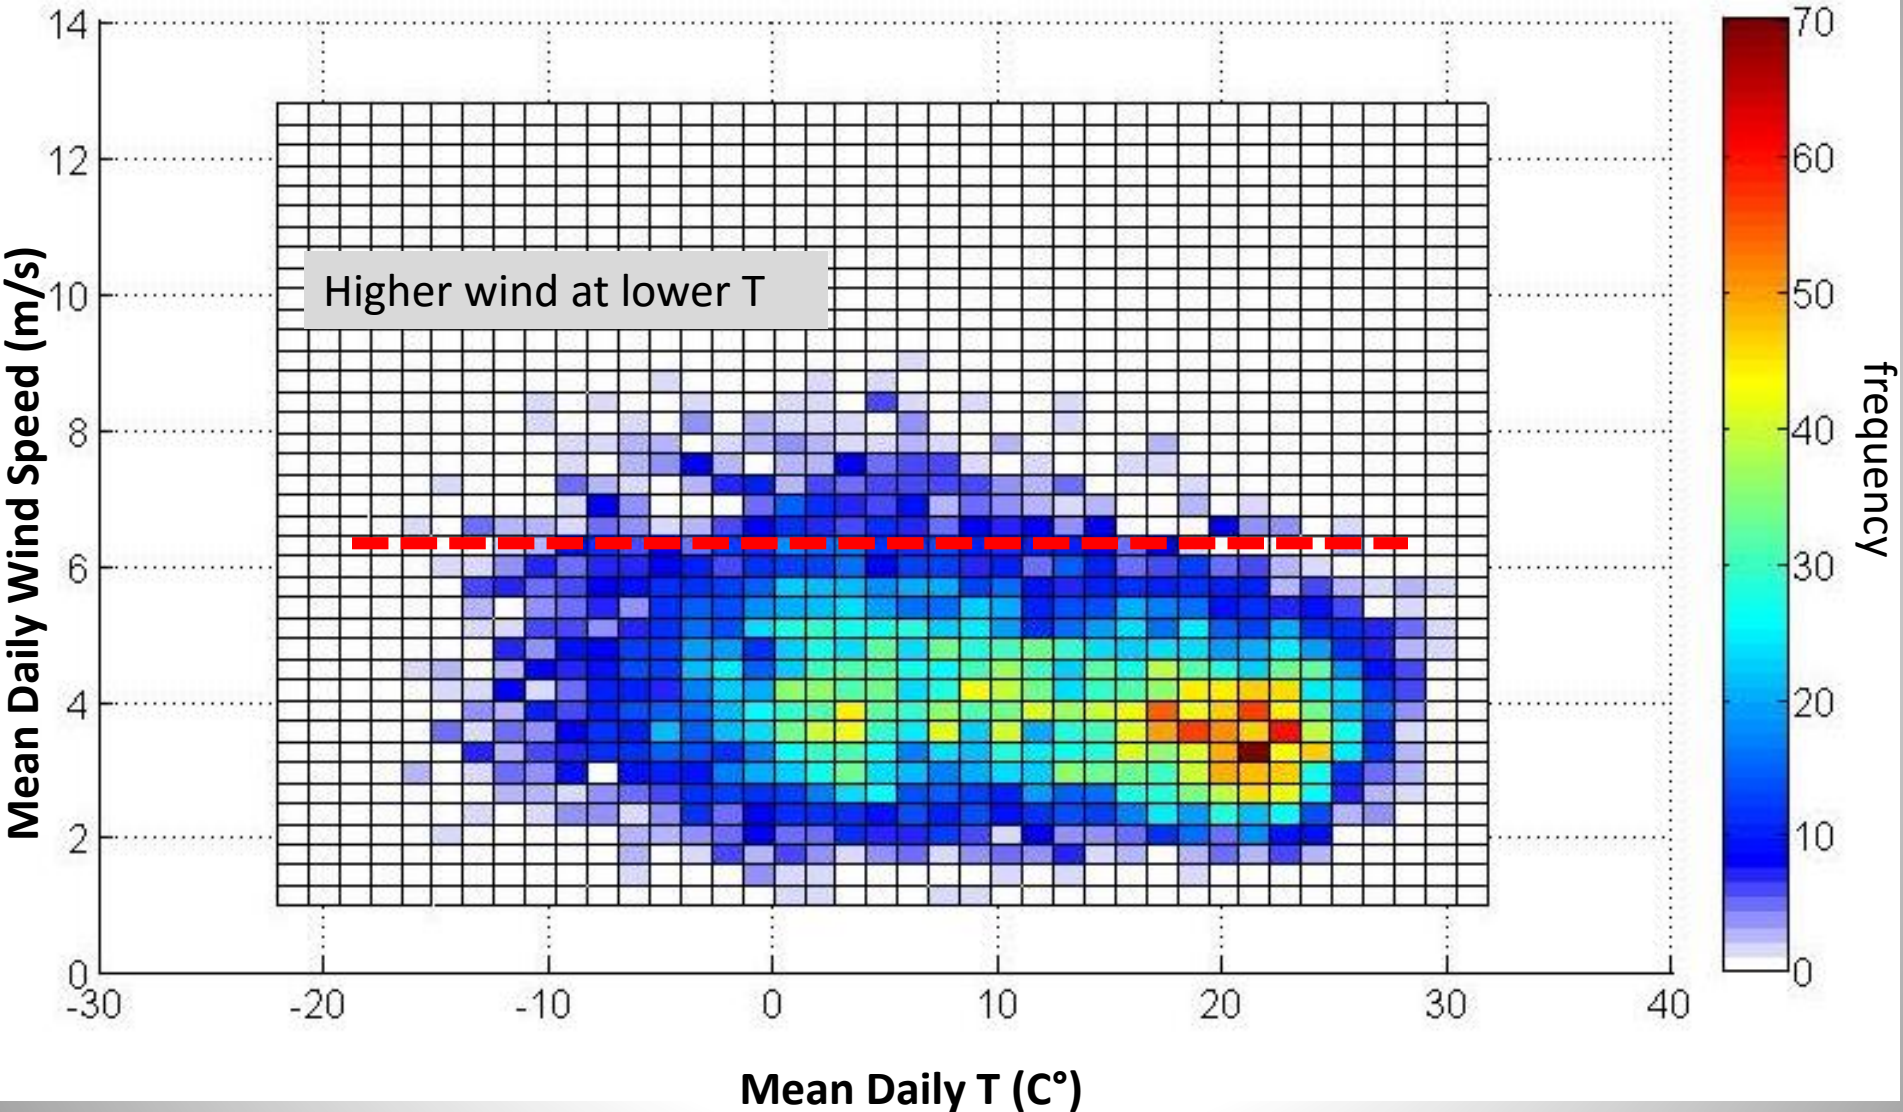

Besides assessing time series of single climate variables, we will also assess correlation among variables in time and space (i.e. across 6 sites)

# Example: Wind vs Solar

Site: Elmira

# Example: Wind vs. Temp.

**BACK-UP SLIDES**

# Accounting for Climate Change

We let historic period set day-to-day variability but shift time series by % change predicted by climate model projections.

# Additional Considerations: Sea Level Rise (SLR)

# ClimAID estimates of SLR

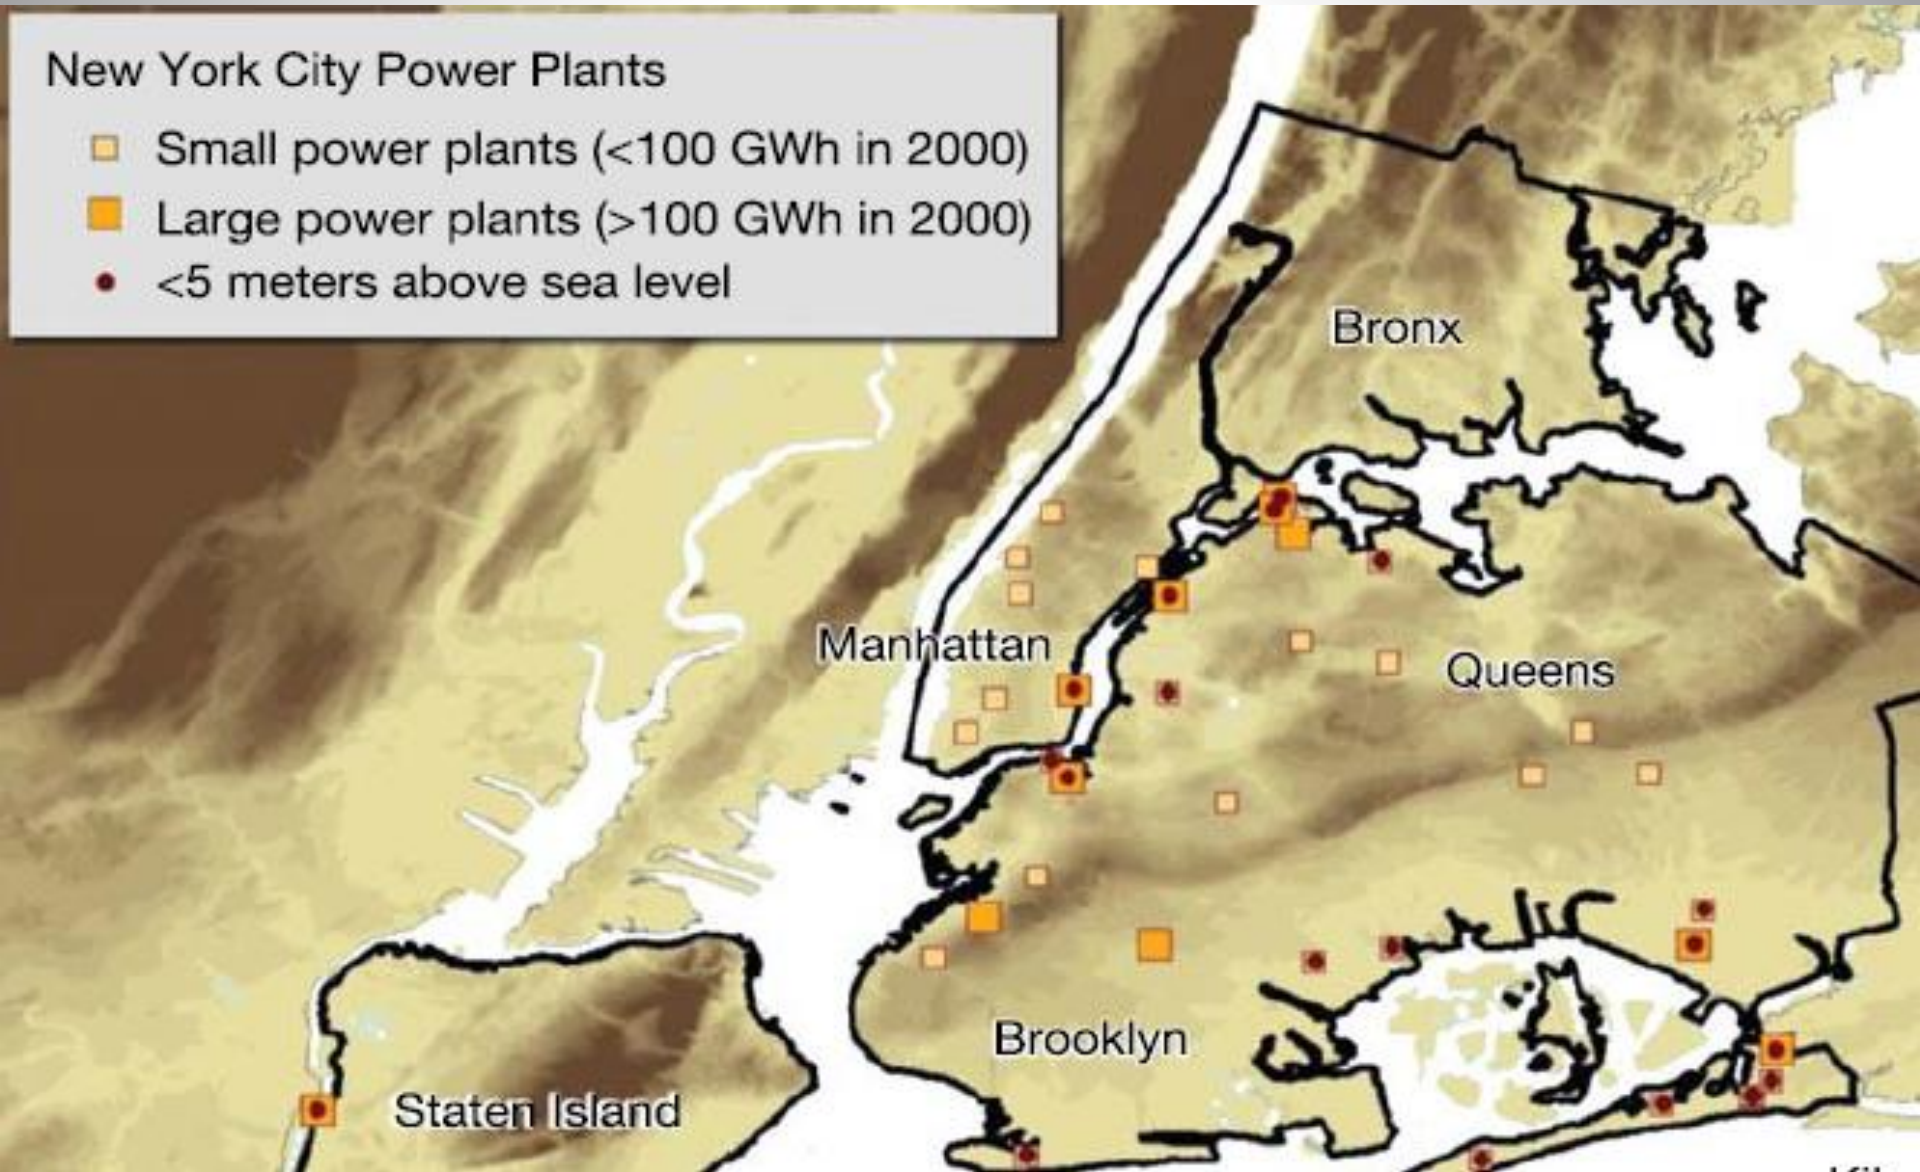

## b. Region 4 – New York City

Baseline (2000-2004) 0 inches	Low Estimate (10th Percentile)	Middle Range (25th to 75th Percentile)	High Estimate (90th Percentile)
2020s	2 in	4 to 8 in	10 in
<u>2050s</u>	8 in	11 to 21 in	30 in
2080s	13 in	18 to 39 in	58 in
2100	15 in	22 to 50 in	75 in

Source: NYSERDA ClimAID, Supplement to Report 11-18

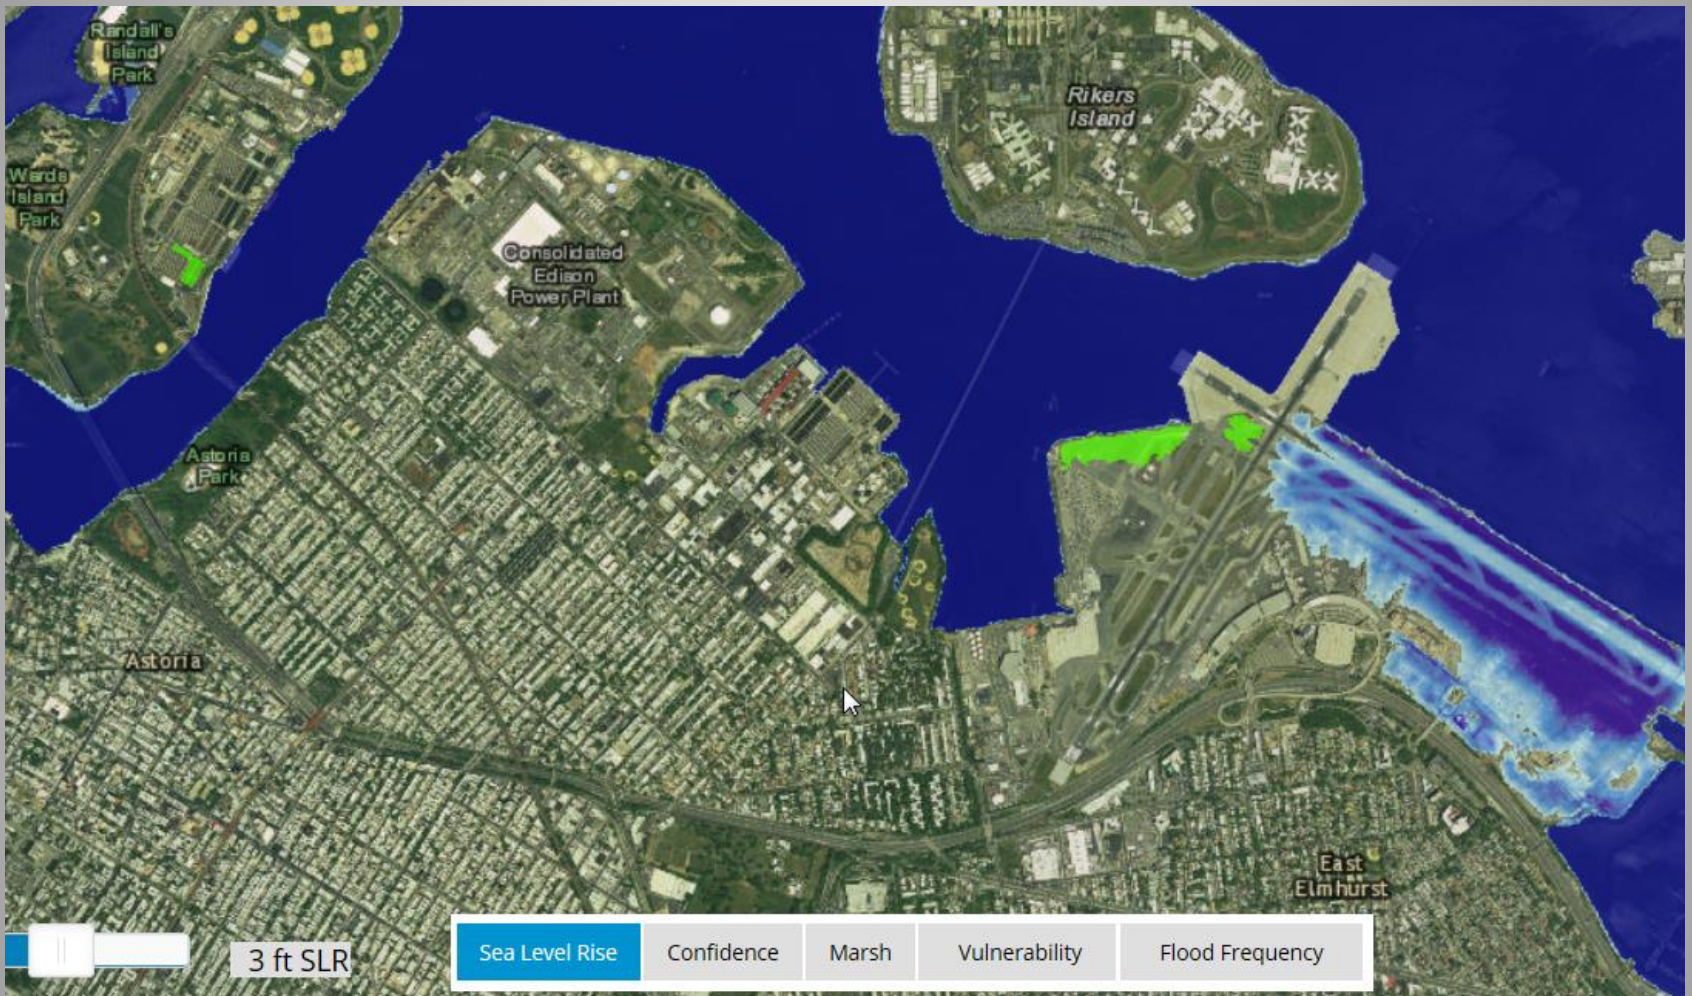

## New York City Power Plants

- Small power plants (<100 GWh in 2000)
- Large power plants (>100 GWh in 2000)
- <5 meters above sea level
